ALBANY DOOR SYSTEMS IN ACTION

RapidRoll® 3000
design, quality and
functionality in
perfect combination

Every day a steady stream of pedestrians, trucks and forklift trucks passes through the door openings of the production hall at Schmid Maschinenbau. The doors in the openings must be both fastacting, safe and operationally reliable.

Speed of opening and closing is a must, partly so that energy losses from the production hall are not excessive, but also so that personnel have a comfortable working environment from the point of view of temperature, even if the traffic through the doors is intensive. RapidRoll 3000 is fast-acting both when opening and closing and is also very reliable operationally.

Naturally a high level of safety is a requirement for all personnel who pass through the doors on a daily basis. RapidRoll 3000 has a very high safety standard with contact-free crush protection and photocells in the door surrounds as standard.

For many modern industrial buildings a great deal of emphasis is now placed on design and the appearance of the building, quite apart from various functional requirements. This is also the case for Schmid Maschinenbau in Germany. From the point of view of design RapidRoll 3000 met all expectations.

Schmid Maschinenbau specialise in the sector-independent development and manufacture of customer-specific special machinery and prototypes, of assembly, automation, handling and interconnection technology as well as robot stations, electrical/electronic technology and engineering. They cover the areas of engine assembly, automation technology, assembly and handling technology, transport systems and interconnections of all types.

Schmid Maschinenbau provides everything in one package. This ranges from the analysis of complex assembly and manufacturing processes via the planning, project management, SE project development and manufacturing according to the customer specification, to installation of the system, after sales service and support services.
